Microsoft Access Database Engine is a Microsoft Access database engine. The Microsoft Access Database Engine includes the Access database engine, with Access itself plus the three following database objects: tables, forms, and queries. Tables are the most commonly used objects. However, as the name suggests, Microsoft Access allows multiple tables. A table stores data in a logical structure defined by the user. The table is simply a container into which data is stored. It stores the name and various other attributes for a specific collection of data that may be of different sizes. Therefore, it is one of the most important parts of a database. In addition to the tables, a database may contain other objects, such as queries, forms, and macros. Queries are flexible queries that produce results, and they enable users to specify the criteria for result selection. Some of the attributes that a table may include are its name, size, linked tables (if it contains any), rows per page (if it is a spread sheet, list, or bound form), number of columns, lock status and hidden status (if it is a table or bound form), and format. Forms are another important part of a database. They are used to present data to users. A form can display tabular, graphical, or descriptive data. Microsoft Access allows users to design customized forms and then easily integrate the forms into a database by linking to the

information stored in the database, using the add-ins feature. Access also supports the embedding of Microsoft PowerPoint presentations using the XML file format. Macros are another important feature of a database engine. They make it possible for users to create custom code, called macros, to automate repetitive or complex procedures or to make it possible to use one or more macros in one database and the same procedure in a separate database. Microsoft Access Database Engine 2010 components include: Access Object Model Access: Access is a cross-platform application database developed by Microsoft. It supports many of the same database and programming features as other Microsoft programs. Access is designed for application development and data management for databases. It supports local and remote data access, including ODBC and OLEDB connections to databases. It supports desktop and mobile applications. It supports some of the same programming features as Visual Basic. Currently, the database is only available for Microsoft Windows platforms. It will be made available for Macintosh platforms in the future. Access: Access is an object-oriented database management system developed by Microsoft.
